

## *QUALITY POLICY*

GB Plastic has always considered that prevention and quality of its products and customers partnership were the foundation of its commercial success.

The aim of GB Plastic is to operate in the production industry of thermoplastic granules, from the material incoming check to the supply of final product, providing exclusively a product that complies with the legislative and contractual requirements, high-quality in terms of reliability and safety, but above all in accord with the customer expectations.

In 1999 the management recognized the opportunity to establish, maintain and document a quality system according to the UNI EN ISO 9002: 1994 standard.

Today business growth, also in connection with the socio-cultural evolution of our country in Europe, has made a further essential effort to make the application of quality and its "management" more efficient.

The adaptation to the new UNI EN ISO 9001: 2015 (ex ISO 9001: 2008) will be an opportunity to improve company management both in terms of internal efficiency and competitiveness on the market. In order to maintain and improve this system, it was necessary to involve and update all the staff at every level of the organization, making them partakers in the actions taken.

The goals, which management has set up and will set up in future improvement plans, have been and must be assumed by the competent functions, as priorities, for the continuous growth of the quality management system. This system has been and will be periodically reviewed in order to ensure its adequacy, at least once a year during the revision process. The operativity of such actions was defined in the new edition of the quality manual, in the procedures and operating instructions.
